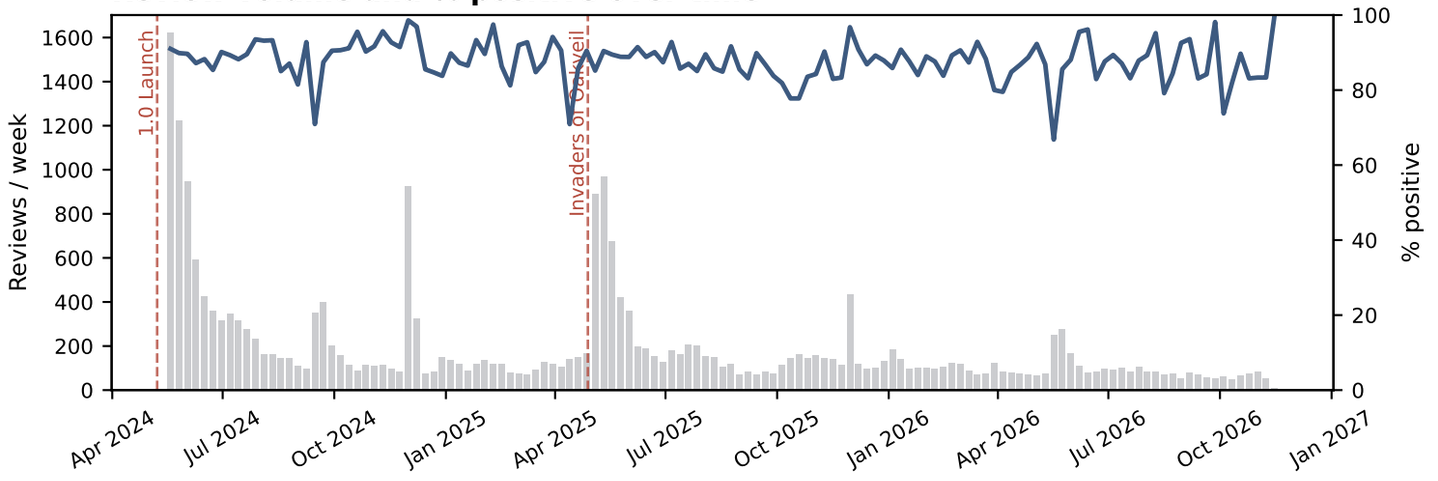
V Rising — Public Steam Review Analysis

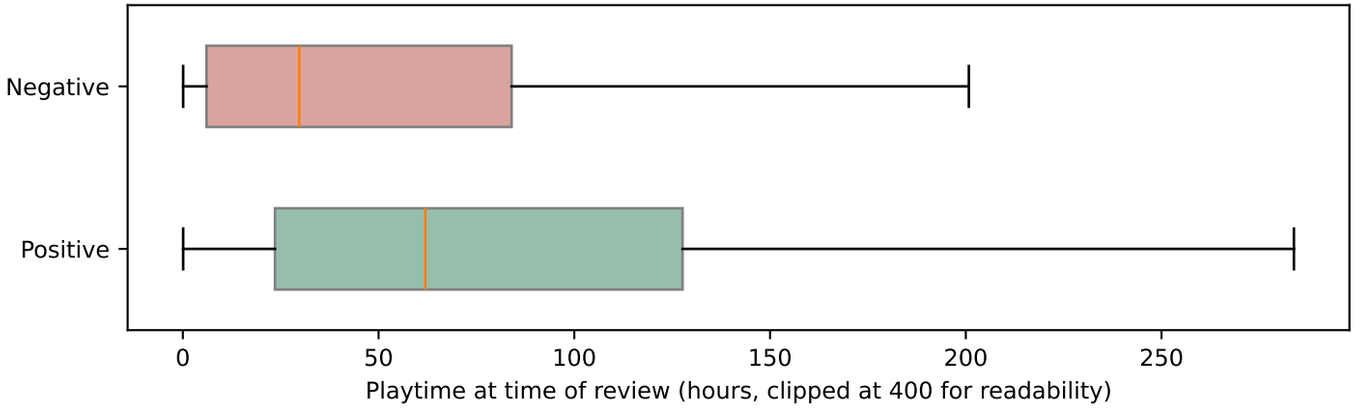
English-language Steam reviews, 2024-05-14 to 2026-11-10 • n = 24,835 • 88% positive overall

Independent fan analysis using Steam's public review data. Not affiliated with or endorsed by Stunlock Studios.

Review volume and % positive over time



Playtime at review: positive vs. negative



Findings

1. Positive reviews have a higher median playtime at review (62h) than negative ones (30h) — people who bounce off the game tend to say so earlier, not after a long investment.
2. % positive moves visibly around major updates (see dashed lines above); volume spikes are a clearer signal of update impact than sentiment alone, which stays fairly stable.
3. Negative reviews cluster around a small number of recurring, nameable gripes rather than being diffuse — see the notebook's topic model for the specific themes and representative phrasing.

Limitations

Steam reviewers are a self-selected, vocal subset of players, not a representative sample; this dataset is English-language reviews only; review text reflects stated opinion, not behavioral telemetry (e.g. actual churn points, session structure).

What internal telemetry could add: exact drop-off points, session length and return cadence by patch, and silent churn from players who never write a review at all.
